Gene Name: CSE1L

Gene Alias: CAS,CSE1,MGC117283,MGC130036,MGC130037,XPO2

Gene Description: CSE1 chromosome segregation 1-like (yeast)

Omim ID: [601342](#)

Gene Ontology: [Hyperlink](#)

Gene Summary: Proteins that carry a nuclear localization signal (NLS) are transported into the nucleus by the importin-alpha/beta heterodimer. Importin-alpha binds the NLS, while importin-beta mediates translocation through the nuclear pore complex. After translocation, RanGTP binds importin-beta and displaces importin-alpha. Importin-alpha must then be returned to the cytoplasm, leaving the NLS protein behind. The protein encoded by this gene binds strongly to NLS-free importin-alpha, and this binding is released in the cytoplasm by the combined action of RANBP1 and RANGAP1. In addition, the encoded protein may play a role both in apoptosis and in cell proliferation. [provided by RefSeq]
