MRPL51 (Human) Recombinant Protein (P01)

Catalog Number: H00051258-P01

Regulation Status: For research use only (RUO)

Product Description: Human MRPL51 full-length ORF (AAH00191, 1 a.a. - 128 a.a.) recombinant protein with GST-tag at N-terminal.

Sequence:

MAGNLLSGAGRRLWDVWPLACRSFSLGVPRLIGIRLT
LPPPKVVDRWNEKRAMFGVYDNIGILGNFEKHPKELIR
GPIWLRGWKGNELQRCIRKRKMVGSRMFADDLHNLN
KRIRYLYKHFNRHGKFR

Host: Wheat Germ (in vitro)

Theoretical MW (kDa): 39.82

Interspecies Antigen Sequence: Mouse (82); Rat (78)

Applications: AP, Array, ELISA, WB-Re

(See our web site product page for detailed applications information)

Protocols: See our web site at

<http://www.abnova.com/support/protocols.asp> or product page for detailed protocols

Preparation Method: [in vitro wheat germ expression system](#)

Purification: Glutathione Sepharose 4 Fast Flow

Storage Buffer: 50 mM Tris-HCl, 10 mM reduced Glutathione, pH=8.0 in the elution buffer.

Storage Instruction: Store at -80°C. Aliquot to avoid repeated freezing and thawing.

Entrez GeneID: 51258

Gene Symbol: MRPL51

Gene Alias: CDA09, HSPC241, MRP64, bMRP64

Gene Summary: Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in

protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes) consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed. Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that the latter contain a 5S rRNA. Among different species, the proteins comprising the mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which prevents easy recognition by sequence homology. This gene encodes a 39S subunit protein. Pseudogenes corresponding to this gene are found on chromosomes 4p and 21q. [provided by RefSeq]
