KD486 : Kidney clear cell carcinoma with matched adjacent kidney tissue array, including TNM and pathology grade, 16 cases/48 cores

Microarray Panel	Renal clear cell carcinoma with matched adjacent kidney tissue microarray, containing 14 cases of kidney clear cell carcinoma and 2 kidney papillary renal cell carcinoma, triplicate cores per case	
Cores	48	
Cases	16	
Row number	6	
Column number	8	
Core Diameter (mm)	2	
Thickness (µm)	5	
Quality Control	Anti-Actin confirmed	
Tissue Array Type	FFPE	
Species	Human	
Applications	Routine histology procedures including Immunohistochemistry (IHC) and In Situ Hybridization (ISH), protocols which can be found at our support page.	
Notes	<p>1. TMA slides were sectioned and stored at 4°C and may not be fresh cut, but still suitable for IHC. Please request fresh cut if experiment involves phospho-specific antibodies, RNA studies, FISH or ISH, etc. A minimum of 3 slides per TMA must be purchased to cover the cost of trimming for fresh sectioning. 2. Most TMA slides were not coated with an extra layer of paraffin (tissue cores can be easily seen on the glass). To prevent tissue detachment during antigen retrieval, unbaked slides must be baked for at least 30 to 120 minutes at 60°C. before putting into xylene for de-paraffinization. Baked slides were sent out baked for 2 hours.</p> <p>In the following specsheet,** means invalid core; "*" means no applicable or negative in IHC markers.</p>	

Legend: Kid - Kidney

● - Adjacent tissue 1.5 cm away from tumor, ● - Malignant tumor, ● - Malignant tumor (stage I), ● - Malignant tumor (stage II), ● - Malignant tumor (stage III)

, tissue IDs are available in exported Excel files.
