**T023** : Esophagus cancer test tissue array, with normal esophagus tissue as control, including TNM, clinical stage and pathology grade, 2 serial sections, 6 cases/24 cores

Microarray Panel	Esophageal carcinoma test tissue microarray, containing 4 cases of malignant tumor (1 each of small cell undifferentiated carcinoma, neuroendocrine carcinoma, adenocarcinoma and squamous cell carcinoma), 2 normal tissue, quadruple cores per case, 2 serial sections, divided into two identical 12 core arrays for testing different antibody dilutions
Cores	24
Cases	6
Row number	3
Column number	8
Core Diameter (mm)	1.5
Thickness (μm)	5
Quality Control	Anti-Actin confirmed
Tissue Array Type	FFPE
Species	Human
Applications	Routine histology procedures including Immunohistochemistry (IHC) and In Situ Hybridization (ISH), protocols which can be found at our support page.
Notes	<p>1. TMA slides were sectioned and stored at 4°C and may not be fresh cut, but still suitable for IHC. Please request fresh cut if experiment involves phospho-specific antibodies, RNA studies, FISH or ISH, etc. A minimum of 3 slides per TMA must be purchased to cover the cost of trimming for fresh sectioning. 2. Most TMA slides were not coated with an extra layer of paraffin (tissue cores can be easily seen on the glass). <b>To prevent tissue detachment during antigen retrieval, unbaked slides must be baked for at least 30 to 120 minutes at 60°C.</b> before putting into xylene for de-paraffinization. Baked slides were sent out baked for 2 hours.</p> <p>In the following specsheets, “**” means invalid core; “-” means no applicable or negative in IHC markers.</p>

Legend: Eso - Esophagus

● - Malignant tumor, ● - Malignant tumor (stage III), ○ - Normal tissue

, tissue IDs are available in exported Excel files.
