Description of Target	The protein encoded by this gene is a member of the MAP kinase family. MAP kinases act as an integration point for multiple biochemical signals, and are involved in a wide variety of cellular processes such as proliferation, differentiation, transcription regulation and development. This kinase is specifically activated by mitogen-activated protein kinase kinase 5 (MAP2K5/MEK5). It is involved in the downstream signaling processes of various receptor molecules including receptor type kinases, and G protein-coupled receptors. In response to extracellular signals, this kinase translocates to cell nucleus, where it regulates gene expression by phosphorylating, and activating different transcription factors. Four alternatively spliced transcript variants of this gene encoding two distinct isoforms have been reported.
Protein Interactions	PRKCZ; NFE2L2; UBE2C; MAP3K2; TP53; MAP2K5; PML; DSG1; DSC1; PFDN6; VBP1; MAPK7; PFDN5; PFDN4; PFDN2; PFDN1; JUP; GAPDH; BAG3; PKM; LDHC; HSP90AB1; HSPA5; HSPA4; ATP5A1; ACTB; PPP3CA; TUBB; MYLK2; GANAB; CDC37; YWHAZ; YWHAH; YWHAG; YWHAE; UBC; HSP90B1; FS
Reconstitution and Storage	All conjugated antibodies should be stored in light-protected vials or covered with a light protecting material (i.e. aluminum foil). Conjugated antibodies are stable for at least 12 months at 4C. If longer storage is desired (24 months), conjugates may be diluted with up to 50% glycerol and stored at -20C to -80C. Freezing and thawing conjugated antibodies will compromise enzyme activity as well as antibody binding.

Image 1	 A schematic diagram of an antibody molecule, represented as a Y-shape. It consists of two heavy chains (the inner vertical lines) and two light chains (the outer diagonal lines), all connected at their base. The two arms of the Y extend upwards and outwards, representing the antigen-binding sites.
