Product Information

5X Annexin Binding Buffer

Size: 15 mL

Concentration: 5X

Form: Colorless solution

Storage and Handling

Product is stable for 6 months at 4 °C.

Product Description

The human anticoagulant annexin V is a 35-36 kilodalton, Ca²⁺-dependent phospholipid-binding protein with high affinity for phosphatidylserine (PS). In normal viable cells, PS is located on the inner leaflet of the cytoplasmic membrane. However, in apoptotic cells, PS is translocated from the inner to the outer leaflet of the plasma membrane, where it can be detected by a fluorescently labeled annexin V. 5X Annexin Binding Buffer is a concentrated stock solution used to prepare 1X Annexin Binding Buffer, which is optimized for staining cells with Annexin V conjugates.

Note: Annexin V cannot be used to stain fixed cells or tissue sections.

Protocol

Dilute the 5X Annexin V Binding Buffer to 1X working concentration with ultra-pure water. Rinse cells once with PBS, followed by 1X Annexin V Binding Buffer. Dilute Annexin V conjugate with 1X Annexin V Binding Buffer and incubate cells for 30 minutes in the dark. Rinse stained cells twice with 1X binding buffer and visualize by fluorescence detection of choice.

Staining concentrations for fluorescent Annexin V conjugates typically range from 0.25 ug/mL to 2.5 ug/mL. We recommend determining the optimal staining concentration empirically. Generally, higher concentrations of Annexin V should be used for microscopy based assays and lower concentrations may be used for flow cytometry.
