### Laboratory Procedures

N-3-oxo-dodecanoyl-L-Homoserine lactone (3-oxo-C12-HSL) is supplied as a crystalline solid. A stock solution may be made by dissolving the 3-oxo-C12-HSL in the solvent of choice, which should be purged with an inert gas. 3-oxo-C12-HSL is soluble in organic solvents such as DMSO and dimethyl formamide. The solubility of 3-oxo-C12-HSL in these solvents is approximately 20 mg/ml. While 3-oxo-C12-HSL is also soluble in ethanol and other primary alcohols, their use is not recommended as they have been shown to open the lactone ring.

### Description

3-oxo-C12-HSL is a bacterial quorum-sensing signaling molecule produced by *P. aeruginosa* and strains of the *B. cepacia* complex.<sup>1,2</sup> It induces the production of IL-8 in 16HBE human bronchial epithelial cells when used at a concentration of 100 μM.<sup>3</sup> Supernatants from 3-oxo-C12-HSL-stimulated 16HBE cells induce chemotaxis of isolated human neutrophils. 3-oxo-C12-HSL has been found in respiratory secretions from patients with cystic fibrosis infected with *P. aeruginosa*.<sup>2</sup>
