Laboratory Procedures

Chromomycin A₃ is supplied as a powder. A stock solution may be made by dissolving the chromomycin A₃ in the solvent of choice. Chromomycin A₃ is soluble in organic solvents such as ethanol, methanol, DMSO, and dimethyl formamide (DMF), which should be purged with an inert gas. The solubility of chromomycin A₃ is approximately 20 mg/ml in ethanol and DMSO and approximately 30 mg/ml in DMF.

Chromomycin A₃ is sparingly soluble in aqueous buffers. For maximum solubility in aqueous buffers, chromomycin A₃ should first be dissolved in DMF and then diluted with the aqueous buffer of choice. Chromomycin A₃ has a solubility of approximately 0.5 mg/ml in a 1:1 solution of DMF:PBS (pH 7.2) using this method. We do not recommend storing the aqueous solution for more than one day.

Description

Chromomycin A₃ is an anthraquinone antibiotic and antitumor agent isolated from *S. griseus* that is used as a fluorescent probe for DNA with excitation/emission spectra of 445/575 nm.^{1,2} Its DNA binding is specific to two or more contiguous GC base pairs, which makes it suitable for characterizing heterochromatin in plants with species-specific AT:GC ratios.^{2,3} Chromomycin A₃ is cytotoxic against non-small cell lung cancer and cervical cancer *in vitro* (IC₅₀s = 1, 42, 60, and 40 nM for HCC44, A549, ME180, and HeLa cells, respectively).^{4,5} It also inhibits oxidative stress- and DNA damage-induced neuronal injury by enhancing Sp1 and Sp3 transcription factor binding.⁶
