Laboratory Procedures

Docosapentaenoyl ethanolamide is supplied as a solution in ethanol. To change the solvent, simply evaporate the ethanol under a gentle stream of nitrogen and immediately add the solvent of choice. Solvents such as ethanol, DMSO, and dimethyl formamide purged with an inert gas can be used. The solubility of docosapentaenoyl ethanolamide in these solvents is approximately 25, 16, and 20 mg/ml, respectively.

Docosapentaenoyl ethanolamide is sparingly soluble in aqueous buffers. For maximum solubility in aqueous buffers, the ethanol solution of docosapentaenoyl ethanolamide should be diluted with the aqueous buffer of choice. Docosapentaenoyl ethanolamide has a solubility of 0.33 mg/ml in a 1:2 solution of ethanol:PBS (pH 7.2) using this method. We do not recommend storing the aqueous solution for more than one day.

Description

Docosapentaenoyl ethanolamide is a long-chain ω-3 fatty acid with a hydroxyethylamide group attached at the alpha chain.
