To change the solvent, simply evaporate the methanol:water:formic acid solution under a gentle stream of nitrogen and immediately add the solvent of choice. Solvents such as ethanol and chloroform purged with an inert gas can be used.

Description

Allicin is a natural product originally isolated from *A. sativum* that has wide-ranging biological effects including antioxidative, anticancer, antimicrobial, and antifungal activities.¹⁻⁴ It inhibits the cysteine proteases cathepsin B and L, facipain 2, and rhodesain with K_i values of 8.6 and 9.3, 1.04, and 5.31 μM, respectively.⁵ It shows antiparasitic activity against *P. falciparum* (IC₅₀ = 5.2 μM) and *T. b. brucei* (IC₅₀ = 13.8 μM), the parasites that cause malaria and African sleeping sickness, respectively. Allicin (5-10 μM) dose-dependently inhibits cell adhesion, invasion, and migration in various lung adenocarcinoma cell lines.² It also alters the balance of tissue inhibitors of matrix metalloproteinases (TIMPs) and matrix metalloproteinases (MMPs), decreases phosphorylation of Akt, and decreases PI3K/Akt signaling.
