#### **Laboratory Procedures**

11β-Prostaglandin  $F_{2\alpha}$ -d<sub>9</sub> (11β-PGF $_{2\alpha}$ -d<sub>9</sub>) is intended for use as an internal standard for the quantification of 11β-PGF $_{2\alpha}$  (Item No. 16520) by GC- or LC-MS. The accuracy of the sample weight in this vial is between 5% over and 2% under the amount shown on the vial. If better precision is required, the deuterated standard should be quantitated against a more precisely weighed unlabeled standard by constructing a standard curve of peak intensity ratios (deuterated versus unlabeled).

11β-PGF<sub>2a</sub>-d<sub>9</sub> is supplied as a solution in ethanol. To change the solvent, simply evaporate the ethanol under a gentle stream of nitrogen and immediately add the solvent of choice. Solvents such as DMSO and dimethyl formamide purged with an inert gas can be used. The solubility of  $11\beta$ -PGF<sub>2a</sub>-d<sub>o</sub> in these solvents is approximately 50 mg/ml.

### Description

11β-PGF<sub>20</sub> is the primary metabolite of PGD<sub>2</sub> (Item No. 12010).<sup>1</sup> It is formed from PGD<sub>2</sub> via the NADPH-dependent aldo-keto reductase PGF synthase (PGFS; Item No. 10007940) in the liver or lung. $^2$  11 $\beta$ -PGF $_{2\alpha}$  induces contraction of isolated cat iris sphincter, which endogenously expresses high levels of PGF<sub>2a</sub> (FP) receptors, with an EC<sub>50</sub> value of 0.045  $\mu$ M.<sup>1</sup> It also induces contraction of isolated human bronchial smooth muscle when used at concentrations ranging from 0.1 to 30  $\mu$ M.<sup>3</sup> 11 $\beta$ -PGF<sub>2a</sub> (0.1 and 1  $\mu$ M) induces phosphorylation of ERK and CREB, as well as increases the viability of MCF-7 breast cancer cells stably expressing the FP receptor when used at concentrations of 0.1 and 1  $\mu$ M.
