### Laboratory Procedures

Maltotriose is supplied as a crystalline solid. A stock solution may be made by dissolving the maltotriose in the solvent of choice, which should be purged with an inert gas. Maltotriose is soluble in organic solvents such as DMSO and dimethyl formamide. The solubility of maltotriose in these solvents is approximately 15 and 20 mg/ml, respectively.

Further dilutions of the stock solution into aqueous buffers or isotonic saline should be made prior to performing biological experiments. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. Organic solvent-free aqueous solutions of maltotriose can be prepared by directly dissolving the crystalline solid in aqueous buffers. The solubility of maltotriose in PBS (pH 7.2) is approximately 3 mg/ml. We do not recommend storing the aqueous solution for more than one day.

### Description

Maltotriose is a trisaccharide consisting of three glucose molecules linked with  $\alpha$ -1,4 glycosidic bonds. It serves as an inducer of the maltose regulon of *E. coli*.<sup>1</sup>
