Laboratory Procedures

Nonyloxytryptamine (oxalate) is supplied as a crystalline solid. A stock solution may be made by dissolving the nonyloxytryptamine (oxalate) in the solvent of choice. Nonyloxytryptamine (oxalate) is soluble in organic solvents such as DMSO and dimethyl formamide (DMF), which should be purged with an inert gas. The solubility of nonyloxytryptamine (oxalate) in these solvents is approximately 20 and 30 mg/ml, respectively. Nonyloxytryptamine (oxalate) is also slightly soluble in ethanol.

Nonyloxytryptamine (oxalate) is sparingly soluble in aqueous buffers. For maximum solubility in aqueous buffers, nonyloxytryptamine (oxalate) should first be dissolved in DMF and then diluted with the aqueous buffer of choice. Nonyloxytryptamine (oxalate) has a solubility of approximately 0.1 mg/ml in a 1:9 solution of DMF:PBS (pH 7.2) using this method. We do not recommend storing the aqueous solution for more than one day.

Description

Nonyloxytryptamine is a potent agonist of the serotonin (5-HT) receptor 5-HT_{1Dβ} with an EC₅₀ value of 68 nM for adenylate cyclase activity in CHOKM6 cells transfected with the human 5-HT_{1Dβ} receptor.¹ It is selective for 5-HT_{1Dβ} over 5-HT_{1A} for its adenylate cyclase activity, with an EC₅₀ greater than 1 μM for 5-HT_{1A}. It binds to 5-HT_{1Dβ}, 5-HT_{1A}, 5-HT_{1B}, 5-HT_{2A}, and 5-HT_{2C} receptors *in vitro* (K_is = 1.2-315 nM). Nonyloxytryptamine also inhibits reovirus-mediated cell death in a dose-dependent manner but has no effect on reovirus attachment or internalization.²
