Laboratory Procedures

Sevoflurane is supplied as a neat oil. A stock solution may be made by dissolving the sevoflurane in the solvent of choice. Sevoflurane is miscible in ethanol, DMSO, dimethyl formamide, and PBS (pH 7.2).

Description

Sevoflurane is a halogenated ether with anesthetic properties.¹ It enhances the activity of GABA_A and glycine receptors and inhibits the activity of nicotinic acetylcholine receptors (nAChRs) and glutamate receptors. Sevoflurane enhances the responses of α₂β₁ subunit-containing GABA_A and α₁ subunit-containing glycine receptors at submaximal agonist concentrations in HEK293 cells (EC₅₀s = 0.45 and 0.36 mM, respectively).² Sevoflurane (360 μM) also increases the amplitude of GABA_A receptor responses to GABA stimulation for receptors with an α₁β₂γ₂ subunit composition.³ It inhibits binding of the high affinity nicotinic agonist epibatidine to nAChRs in mouse brain membranes (IC₅₀ = 0.77 mM).⁴ Formulations containing sevoflurane have been used in the induction and maintenance of general anesthesia.
