Laboratory Procedures

Didecanoin is supplied as a liquid. A stock solution may be made by dissolving the didecanoin in the solvent of choice, which should be purged with an inert gas. Didecanoin is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide. The solubility of didecanoin in these solvents is approximately 30, 5, and 20 mg/ml, respectively.

Further dilutions of the stock solution into aqueous buffers or isotonic saline should be made prior to performing biological experiments. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. Organic solvent-free aqueous solutions of didecanoin can be prepared by directly dissolving the liquid in aqueous buffers. The solubility of didecanoin in PBS, pH 7.2, is approximately 0.25 mg/ml. We do not recommend storing the aqueous solution for more than one day.

Description

Didecanoin is a diacylglycerol that contains the saturated medium-chain fatty acid decanoic acid (Item No. 20838) at two positions.
