Laboratory Procedures

Toremifene-d₆ is intended for use as an internal standard for the quantification of toremifene (Item No. 20854) by GC- or LC-MS. The accuracy of the sample weight in this vial is between 5% over and 2% under the amount shown on the vial. If better precision is required, the deuterated standard should be quantitated against a more precisely weighed unlabeled standard by constructing a standard curve of peak intensity ratios (deuterated versus unlabeled).

Toremifene-d₆ is supplied as a solid. A stock solution may be made by dissolving the toremifene-d₆ in the solvent of choice, which should be purged with an inert gas. Toremifene-d, is soluble in chloroform.

Description

Toremifene is an orally bioavailable selective estrogen receptor modulator (SERM) that evokes tissue-dependent effects similar to that of tamoxifen (Item Nos. 13258 | 11629).¹ It has been shown to block estrogen-stimulated growth of MCF-7 breast cancer cells grown in tissue culture, to inhibit ovariectomy-induced bone loss in rats, and to stimulate endometrial growth similar to that of tamoxifen.²
