Laboratory Procedures

Indolicidin (trifluoroacetate salt) is supplied as a solid. A stock solution may be made by dissolving the indolicidin (trifluoroacetate salt) in the solvent of choice, which should be purged with an inert gas. Indolicidin (trifluoroacetate salt) is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide. The solubility of indolicidin (trifluoroacetate salt) in these solvents is approximately 2, 5, and 10 mg/ml, respectively.

Description

Indolicidin is an antimicrobial peptide.¹ It is active against multidrug-resistant isolates of enteroaggregative *E. coli* (MDR-EAEC; MICs = 32 μM for all). Indolicidin is also active against *S. cerevisiae*, *T. beigellii*, and *C. albicans* (MICs = 5-10, 2.5-5, and 5-10 μM, respectively) and reduces viral replication of HIV-1 in MT-2 cells when used at concentrations ranging from 67 to 100 μg/ml.^{2,3} *In vivo*, indolicidin increases survival of MDR-EAEC-infected *G. mellonella* larvae.¹
