Information represents the product specifications. Batch specific analytical results are provided on each certificate of analysis.

### Laboratory Procedures

Hygromycin B is supplied as a solid. A stock solution may be made by dissolving the hygromycin B in the solvent of choice, which should be purged with an inert gas. Hygromycin B is soluble in the organic solvent DMSO at a concentration of approximately 10 mg/ml.

Further dilutions of the stock solution into aqueous buffers or isotonic saline should be made prior to performing biological experiments. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. Organic solvent-free aqueous solutions of hygromycin B can be prepared by directly dissolving the solid in aqueous buffers. The solubility of hygromycin B in PBS (pH 7.2) is approximately 10 mg/ml. We do not recommend storing the aqueous solution for more than one day.

### Description

Hygromycin B is an aminoglycoside antibiotic that has been found in *S. hygroscopicus*.<sup>1,2</sup> It is active against *E. coli* (MIC = 150 µg/ml) and cytotoxic to both prokaryotic and eukaryotic cells via inhibition of protein synthesis.<sup>3-5</sup> Hygromycin B has commonly been used in molecular and cell biology applications to select for transformed cells expressing the *E. coli* hygromycin resistance genes *hyg* or *hph*.<sup>4,5</sup>
