Laboratory Procedures

CMP8 is supplied as a solid. A stock solution may be made by dissolving the CMP8 in the solvent of choice, which should be purged with an inert gas. CMP8 is soluble in DMSO.

Description

CMP8 is a mutant estrogen receptor α (ER α) antagonist and ligand used for bump and hole, a technique to study single protein isoforms when familial homology would interfere with other isoform-selective approaches.¹ It is selective for an ER α triple mutant containing a lysine-to-methionine substitution at position 384 (ER α ^{L384M}), a methionine-to-glycine substitution at position 421 (ER α ^{M421G}), and a glycine-to-arginine substitution at position 521 (ER α ^{G521R}), over wild-type ER α and ER β (IC₅₀s = 29, 1,085, and 2,232 nM, respectively). It reduces reporter gene expression in HeLa cells expressing the triple mutant ER α (EC₅₀ = 41 nM).
