### Laboratory Procedures

Perfluoro-4-methoxybutanoic acid (PF5OHxA) is supplied as a liquid. A stock solution may be made by dissolving the PF5OHxA in the solvent of choice, which should be purged with an inert gas. PF5OHxA is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide. The solubility of PF5OHxA in these solvents is approximately 10 mg/ml.

Further dilutions of the stock solution into aqueous buffers or isotonic saline should be made prior to performing biological experiments. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. Organic solvent-free aqueous solutions of PF5OHxA can be prepared by directly dissolving the liquid in aqueous buffers. The solubility of PF5OHxA in PBS (pH 7.2) is approximately 10 mg/ml. We do not recommend storing the aqueous solution for more than one day.

### Description

PF5OHxA is a perfluoroalkyl substance (PFAS).<sup>1</sup> PF5OHxA has been found as a contaminant in wastewater.
