Laboratory Procedures

Spike binding peptide 1 (SBP1) (trifluoroacetate salt) is supplied as a solid. A stock solution may be made by dissolving the SBP1 (trifluoroacetate salt) in the solvent of choice, which should be purged with an inert gas. SBP1 (trifluoroacetate salt) is soluble in a 10% solution of acetonitrile/water.

Description

SBP1 is a peptide that corresponds to amino acids 21-43 of angiotensin-converting enzyme 2 (ACE2).¹ Lipid nanoparticles (LNPs) encapsulating the antiviral compound oseltamivir phosphate have been conjugated to SBP1 and studied *in vitro* to estimate their potential for providing controlled, long-term release of oseltamivir phosphate *in vivo*.¹ SBP1 (2%) immobilized to crosslinked networks of hydroxy acrylate and ethylxanthate ethyl acrylate, increases network capture efficiency of severe acute respiratory coronavirus 2 (SARS-CoV-2) spike glycoprotein, also known as surface glycoprotein, *in vitro*.²
