Laboratory Procedures

M-3258 is supplied as a solid. A stock solution may be made by dissolving the M-3258 in the solvent of choice, which should be purged with an inert gas. M-3258 is soluble in the organic solvent DMSO at a concentration of approximately 30 mg/ml.

Description

M-3258 is an inhibitor of the immunoproteasome subunit large multifunctional peptidase 7 (LMP7; IC₅₀ = 4.1 nM).¹ It is selective for LMP7 over the 20S proteasomal catalytic subunits β1, -β2, and -β5 (IC₅₀s = >10,000, 2,519, and >10,000 nM, respectively), as well as LMP2 and proteasome subunit beta type 10 (PSMB10; IC₅₀s = >10,000 nM for both). It increases ubiquitinated protein levels (EC₅₀ = 1,980 nM) and induces apoptosis in MM.1S multiple myeloma cells (EC₅₀ = 420 nM). M-3258 (10 mg/kg per day) reduces tumor volume in U266B1, OPM-2, and RPMI-8226 mouse xenograft models of multiple myeloma.
