Laboratory Procedures

p-methyl-N-salicyloyl Tryptamine is supplied as a solid. A stock solution may be made by dissolving the *p*-methyl-N-salicyloyl tryptamine in the solvent of choice, which should be purged with an inert gas. *p*-methyl-N-salicyloyl Tryptamine is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide. The solubility of *p*-methyl-N-salicyloyl tryptamine in these solvents is approximately 10 mg/ml.

Description

p-methyl-N-salicyloyl Tryptamine is a neuroprotective agent and derivative of N-salicyloyl tryptamine.¹ It reduces LPS-induced nitric oxide (NO) production in C6 rat glioma cells and BV-2 mouse microglia (IC₅₀s = 7.48 and 4.94 μM, respectively). It also reduces LPS-induced production of TNF-α and prostaglandin E₂ (PGE₂; Item No. 14010) and increases production of IL-10 in BV-2 microglia when used at a concentration of 40 μM. *In vivo*, *p*-methyl-N-salicyloyl tryptamine (25-100 mg/kg) decreases cortical and hippocampal amyloid-β (Aβ) plaque formation and neuronal pyroptosis, as well as improves spatial learning and memory, in a mouse model of Aβ-induced Alzheimer's disease.²
