Laboratory Procedures

Dihydromyristicin is supplied as a solution in ethanol. To change the solvent, simply evaporate the ethanol under a gentle stream of nitrogen and immediately add the solvent of choice. Solvents such as DMSO purged with an inert gas can be used. Dihydromyristicin is soluble in the organic solvent DMSO at a concentration of approximately 10 mM.

Description

Dihydromyristicin is a derivative of the alkenylbenzene myristicin.¹ It induces glutathione S-transferase (GST) activity in the liver and small intestinal mucosa, but not the forestomach, lungs, large intestinal mucosa, or bladder, in mice when administered at a dose of 20 mg/animal.
