Laboratory Procedures

Calicheamicin γ_1 is supplied as a solid. A stock solution may be made by dissolving the calicheamicin γ_1 in the solvent of choice, which should be purged with an inert gas. Calicheamicin γ_1 is slightly soluble (0.1-1 mg/ml) in acetonitrile and methanol and sparingly soluble (1-10 mg/ml) in DMSO.

Calicheamicin γ_1 is sparingly soluble (1-10 mg/ml) in aqueous solutions. To enhance aqueous solubility, dilute the organic solvent solution into aqueous buffers or isotonic saline. If performing biological experiments, ensure the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. We do not recommend storing the aqueous solution for more than one day.

Description

Calicheamicin γ_1 is a polyketide synthase-derived enediyne that has been found in *M. echinospora*.¹ It is composed of carbohydrate and aromatic moieties, which bind to the minor groove in DNA, and a warhead moiety that aromatizes and oxidatively induces double-stranded DNA scission in cell-free assays.^{2,3}
