Laboratory Procedures

(D-Phe⁷)-α-Melanocyte-stimulating hormone ((D-Phe⁷)-α-MSH) (trifluoroacetate salt) is supplied as a solid. A stock solution may be made by dissolving the (D-Phe⁷)-α-MSH (trifluoroacetate salt) in the solvent of choice, which should be purged with an inert gas. (D-Phe⁷)-α-MSH (trifluoroacetate salt) is soluble (≥10 mg/ml) in DMSO and sparingly soluble (1-10 mg/ml) in ethanol.

Further dilutions of the stock solution into aqueous buffers or isotonic saline should be made prior to performing biological experiments. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. Organic solvent-free aqueous solutions of (D-Phe⁷)-α-MSH (trifluoroacetate salt) can be prepared by directly dissolving the solid in aqueous buffers. (D-Phe⁷)-α-MSH (trifluoroacetate salt) is soluble (≥10 mg/ml) in PBS (pH 7.2). We do not recommend storing the aqueous solution for more than one day.

Description

(D-Phe⁷)-α-MSH is a peptide derivative of α-MSH (Item No. 29923) and an intermediate in the synthesis of α-MSH cyclic analogs.¹
