Laboratory Procedures

For long term storage, we suggest that R-2 Methanandamide be stored as supplied at -20°C. It should be stable for at least one year.

R-2 Methanandamide is supplied as a solution in ethanol. To change the solvent, simply evaporate the ethanol under a gentle stream of nitrogen and immediately add the solvent of choice. Solvents such as DMSO, dimethyl formamide, or acetonitrile purged with an inert gas or nitrogen can be used. Further dilutions of the stock solution into aqueous buffers or isotonic saline should be made prior to performing biological experiments. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations.

R-2 Methanandamide is a cannabinoid analog with a methyl group in the (R) configuration at C-2 of the ethanolamine group. In contrast to the other methyl-anandamide analogs, R-2 methanandamide is not an amidohydrolase inhibitor and is nearly as susceptible to amide hydrolysis as AEA itself.¹
