Recombinant Human LIF Protein (HEK293 Cells)

Catalog Number: PKSH031989

Note: Centrifuge before opening to ensure complete recovery of vial contents.

Description

Synonyms Leukemia Inhibitory Factor; LIF; Differentiation-Stimulating Factor; D

Factor; Melanoma-Derived LPL

Inhibitor;MLPLI;Emfilermin;LIF;HILDA;CDF;DIA

Species Human

Expression Host HEK293 Cells **Sequence** Met 1-Phe202

AccessionP15018Calculated Molecular Weight19.7 kDaObserved molecular weight35.4 kDaTagNone

Bioactivity Measured by its ability to inhibit the proliferation of M1 mouse myeloid leukemia

cells. The ED50 for this effect is typically 0.2-0.8 ng/mL.

Properties

Purity > 95 % as determined by reducing SDS-PAGE.

Endotoxin < 1.0 EU per µg of the protein as determined by the LAL method.

Storage Generally, lyophilized proteins are stable for up to 12 months when stored at -20 to

-80°C. Reconstituted protein solution can be stored at 4-8°C for 2-7 days. Aliquots

of reconstituted samples are stable at < -20°C for 3 months.

Shipping This product is provided as lyophilized powder which is shipped with ice packs.

Formulation Lyophilized from sterile PBS, pH 7.4.

Normally 5 % - 8 % trehalose, mannitol and 0.01% Tween80 are added as

protectants before lyophilization.

Please refer to the specific buffer information in the printed manual.

Reconstitution Please refer to the printed manual for detailed information.

Data

> 95 % as determined by reducing SDS-PAGE.

Background

Leukemia inhibitory factor (LIF) is a pleiotropic glycoprotein belonging to the IL-6 family of cytokines. It's involved in growth promotion and cell differentiation of different types of target cells; influence on bone metabolism; cachexia; neural development; embryogenesis and inflammation. LIF has potent proinflammatory property; being the inducer of the acute phase protein synthesis and affecting the cell recruitment into the area of damage or inflammation. LIF is also one

of the cytokines that are capable to regulate the differentiation of embryonic stem cells; hematopoietic and neuronal cells. LIF binds to the specific LIF receptor (LIFR- α) which forms a heterodimer with a specific subunit common to all members of that family of receptors; the GP130 signal transducing subunit. This leads to activation of the JAK/STAT and MAPK cascades. Due to its polyfunctional activities; LIF is involved in the pathogenic events and development of many diseases of various origin.
