BIOLOGICAL ACTIVITY

Description

3-MeOARh-NTR is an activatable imaging probe with high selectivity, and good stability. 3-MeOARh-NTR possesses high selectivity and high signal-to-noise ratio for nitroreductase (NTR) detection, and serves as an efficient molecular tool for endogenous NTR detection^[1].

In Vitro

3-MeOARh-NTR (10 μ M, 30 min; cell incubated with 20% O₂ and 10% O₂ for 12 h) produces a strong fluorescence signal in living HeLa cells with decreasing oxygen contents^[1].
 3-MeOARh-NTR (10 μ M, 30 min) produces fluorescence imaging of kidney tissues from mice with λ_{ex} = 488 nm and λ_{em} = 510-590 nm. Thus, 3-MeOARh-NTR is a efficient probe to evaluate kidney hypoxia by NTR detection^[1].
 MCE has not independently confirmed the accuracy of these methods. They are for reference only.
