BIOLOGICAL ACTIVITY

Description	DMA trihydrochloride is a fluorescent compound (λ_{ex} =340 nm, λ_{em} =478 nm).
IC₅₀ & Target	IC ₅₀ : 3.4 μ M (HeLa cell), 5.3 μ M (MCF7 cell) ^[1]
In Vitro	The newly synthesized bisbenzimidazole derivatives DMA (6c) is evaluated for their cytotoxicity against human tumor cell lines, which are cervix carcinoma cell line (HeLa), breast carcinoma cell line (MCF7) and brain glioma cell line (U87) in comparison to Hoechst. In case of MCF7, the IC ₅₀ is observed at 5.3 μ M for DMA. The IC ₅₀ determined in the case of HeLa is 3.4 μ M for DMA ^[1] . MCE has not independently confirmed the accuracy of these methods. They are for reference only.

PROTOCOL

Cell Assay

Various human tumor cells (U87, HeLa and MCF7) are maintained as monolayer at 37°C in 5% CO₂ using DMEM medium. Approximately 3000-8000 cells/well are seeded in 96-well plates containing 200 µL of medium and incubated for 24 h. The culture medium is replaced by fresh medium containing 1, 10, 50, 100 µM of DMA (6c) and incubated for 24, 48 and 72 h. The cell viability is determined by the MTT assay. The light absorbance is measured using a microplate reader^[1]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
