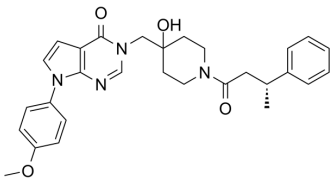
YCH2823

Cat. No.:	HY-158039
Molecular Formula:	$C_{29}H_{32}N_4O_4$
Molecular Weight:	500.59
Target:	Deubiquitinase; Apoptosis
Pathway:	Cell Cycle/DNA Damage; Apoptosis
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.



BIOLOGICAL ACTIVITY

Description	YCH2823 is an inhibitor of USP7 (IC_{50} = 49.6 nM; K_d = 0.117 μM). YCH2823 shows significant efficacy in inhibiting TP53 wild-type and mutant tumors, with approximately 5-fold higher potency than FT671. YCH2823 induce apoptosis. YCH2823 synergistic effects with mTOR inhibitors[1].
IC_{50} & Target	USP7 49.6 nM (IC_{50})

In Vitro

YCH2823 interacts directly with USP7 with high affinity and effectively inhibits its enzymatic activity. Potentially low toxicity to IMR-90 cells[1].

YCH2823 (0-10 μM; 72 h or 5 days) demonstrates significant dose-dependent inhibition of cell proliferation across different cancer cell lines. High sensitivity to TP53 wild-type, mutant. [1].

YCH2823 (0-1 μM; 1-48 h) affects protein stability and cell cycle regulation. It leads to decrease in MDM2 protein levels within 1 h and elevation of p53 and p21 levels in LNCaP cells. In MM.1S cells, although p53 protein levels do not change significantly, p21 levels are independently higher, indicating a possible p53-independent pathway for p21 induction.n the TP53 mutant Capan-1 resulted in a significant decrease in Rad18 and DNMT1 proteins, along with an increase in p21 levels[1] .

YCH2823 (0-1 μM; 6-48 h) causes up-regulation of BCL6 protein and mRNA. It induces apoptosis by increasing the proportion of cells in G1 phase in CHP212 cells and IMR-32 cells. The manipulations of DNMT1, p53, and p21 has no impact on the YCH2823-induced upregulation of BCL6[1].

YCH2823 with Rapamycin (HY-10219) or Ridaforolimus (HY-50908) results in a synergistic effect, where is more effective than either agent alone[1].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Apoptosis Analysis[1]

Cell Line:	CHP-212 cells
Concentration:	0, 0.03, 0.1, 0.3, 1 μM
Incubation Time:	48 h
Result:	Induced significant apoptosis, demonstrating YCH2823's capacity to induce programmed cell death.

Western Blot Analysis[1]

Cell Line:	CHP212 cells
Concentration:	0, 0.1, 0.3, 1 μM
Incubation Time:	6-48 h
Result:	YCH2823 led to a significant upregulation of BCL6 protein and mRNA, observable as early as 6 hours post-treatment and sustained over time. This suggests that YCH2823 may impact transcriptional regulation related to BCL6. Also led the decreases in Rad18 and DNMT1 suggesting effects on DNA repair mechanisms.
