Ethambutol

Cat. No.:	HY-B0535		
CAS No.:	74-55-5		
Molecular Formula:	$C_{10}H_{24}N_2O_2$		
Molecular Weight:	204.31		
Target:	Bacterial; Antibiotic		
Pathway:	Anti-infection		
Storage:	Powder	-20°C	3 years
		4°C	2 years
In solvent	-80°C	6 months	
	-20°C	1 month	

SOLVENT & SOLUBILITY

In Vitro

DMSO : 100 mg/mL (489.45 mM; Need ultrasonic)

Preparing Stock Solutions	Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	4.8945 mL	24.4726 mL	48.9452 mL
	5 mM	0.9789 mL	4.8945 mL	9.7890 mL
	10 mM	0.4895 mL	2.4473 mL	4.8945 mL

Please refer to the solubility information to select the appropriate solvent.

BIOLOGICAL ACTIVITY

Description

Ethambutol is a bacteriostatic antimycobacterial agent, which obstructs the formation of cell wall by inhibiting arabinosyl transferases. Target: Antibacterial Ethambutol directly affects two polymers, arabinogalactan (AG) and lipoarabinomannan (LAM) in *Mycobacterium smegmatis*. In *M. smegmatis*, Ethambutol inhibits synthesis of arabinan completely and inhibits AG synthesis most likely as a consequence of this; more than 50% of the cell arabinan is released from the bacteria following Ethambutol treatment, whereas no galactan is released. Ethambutol main targets against embB gene product in *M. avium*. Ethambutol induces 60% changes in the embB gene in *M. tuberculosis* resistant mutants [1]. Ethambutol is effective against actively growing microorganisms of the genus *Mycobacterium*, including *M. tuberculosis*. Nearly all strains of *M. tuberculosis* and *M. kansasii* as well as a number of strains of the *M. avium* complex (MAC) are sensitive to Ethambutol. [1] Ethambutol is potent against *M. tuberculosis* (H37Rv) with MIC of 0.5 µg/mL in vitro [2]. Ethambutol is efficient on treatment of mycobacterial-infected macrophages. When *M. tuberculosis* infected macrophages are treated with 6 µg/mL Ethambutol, the log CFUs following treatment for 3 days is 4.17, while value in control group is 4.8. The MICs for *M. avium* (MTCC 1723) and *M. smegmatis* (MTCC 6) are 15 µg/mL and 0.18 µg/mL, respectively. Ethambutol is efficient in animal model. 100 mg/kg Ethambutol given orally 15 days post i.v. infection 1 ×/week for 5 weeks, induces a lower log CFU compared with untreated (4.59 vs 5.07) [3].

CUSTOMER VALIDATION

- ACS Chem Biol. 2021 Dec 15.
