CCDC8 (h): 293T Lysate: sc-177038

BACKGROUND

The coiled-coil domain is a structural motif found in proteins that are involved in a diverse array of biological functions such as the regulation of gene expression, cell division, membrane fusion and drug extrusion and delivery. CCDC8 (coiled-coil domain-containing protein 8) is a 538 amino acid protein that is phosphorylated upon DNA damage, likely by ATM or ATR. The gene encoding CCDC8 maps to human chromosome 19, which consists of over 63 million bases and houses approximately 1,400 genes. Chromosome 19 is recognized for having the greatest gene density of the human chromosomes. It is the genetic home for a number of immunoglobulin (Ig) superfamily members, including the killer cell and leukocyte Ig-like receptors, a number of ICAMs, the CEACAM and PSG family and Fc receptors (FcRs). Key genes for eye color and hair color also map to chromosome 19.

CHROMOSOMAL LOCATION

Genetic locus: CCDC8 (human) mapping to 19q13.32.

PRODUCT

CCDC8 (h): 293T Lysate represents a lysate of human CCDC8 transfected 293T cells and is provided as 100 µg protein in 200 µl SDS-PAGE buffer.

APPLICATIONS

CCDC8 (h): 293T Lysate is suitable as a Western Blotting positive control for human reactive CCDC8 antibodies. Recommended use: 10-20 µl per lane.

Control 293T Lysate: sc-117752 is available as a Western Blotting negative control lysate derived from non-transfected 293T cells.

STORAGE

Store at -20° C. Repeated freezing and thawing should be minimized. Sample vial should be boiled once prior to use. Non-hazardous. No MSDS required.

RESEARCH USE

For research use only, not for use in diagnostic procedures.

PROTOCOLS

See our web site at www.scbt.com for detailed protocols and support products.
