# MMP-10 siRNA (h): sc-41555

The Power to Questio

# **BACKGROUND**

The matrix metalloproteinases (MMP) are a family of peptidase enzymes responsible for the degradation of extracellular matrix components, including collagen, gelatin, Fibronectin, Laminin and proteoglycan. Transcription of MMP genes is differentially activated by phorbol ester, lipopolysaccharide (LPS) or staphylococcal enterotoxin B (SEB). MMP catalysis requires both calcium and zinc. MMP-10, also known as Stromelysin-2, is expressed in small intestine and at lower levels in lung and heart. MMP-10 functions similarly to MMP-3 in that it can degrade Fibronectin and gelatins type I, III, IV and IV, however its action on collagens III, IV and V is very weak. Significantly, expression of MMP-10 is upregulated in ras-transformed HaCaT II-4 keratinocytes, therefore enabling the cells to undergo epithelial-to-mesenchymal transition. This evidence suggests that MMP-10, as well as other matrix metalloproteinases, may play a significant role in tumor metastasis.

# CHROMOSOMAL LOCATION

Genetic locus: MMP10 (human) mapping to 11q22.2.

# **PRODUCT**

MMP-10 siRNA (h) is a pool of 3 target-specific 19-25 nt siRNAs designed to knock down gene expression. Each vial contains 3.3 nmol of lyophilized siRNA, sufficient for a 10  $\mu$ M solution once resuspended using protocol below. Suitable for 50-100 transfections. Also see MMP-10 shRNA Plasmid (h): sc-41555-SH and MMP-10 shRNA (h) Lentiviral Particles: sc-41555-V as alternate gene silencing products.

For independent verification of MMP-10 (h) gene silencing results, we also provide the individual siRNA duplex components. Each is available as 3.3 nmol of lyophilized siRNA. These include: sc-41555A, sc-41555B and sc-41555C.

#### STORAGE AND RESUSPENSION

Store lyophilized siRNA duplex at -20 $^{\circ}$  C with desiccant. Stable for at least one year from the date of shipment. Once resuspended, store at -20 $^{\circ}$  C, avoid contact with RNAses and repeated freeze thaw cycles.

Resuspend lyophilized siRNA duplex in 330  $\mu$ l of the RNAse-free water provided. Resuspension of the siRNA duplex in 330  $\mu$ l of RNAse-free water makes a 10  $\mu$ M solution in a 10  $\mu$ M Tris-HCl, pH 8.0, 20 mM NaCl, 1 mM EDTA buffered solution.

# **APPLICATIONS**

MMP-10 siRNA (h) is recommended for the inhibition of MMP-10 expression in human cells.

#### **SUPPORT REAGENTS**

For optimal siRNA transfection efficiency, Santa Cruz Biotechnology's siRNA Transfection Reagent: sc-29528 (0.3 ml), siRNA Transfection Medium: sc-36868 (20 ml) and siRNA Dilution Buffer: sc-29527 (1.5 ml) are recommended. Control siRNAs or Fluorescein Conjugated Control siRNAs are available as 10 µM in 66 µl. Each contain a scrambled sequence that will not lead to the specific degradation of any known cellular mRNA. Fluorescein Conjugated Control siRNAs include: sc-36869, sc-44239, sc-44240 and sc-44241. Control siRNAs include: sc-37007, sc-44230, sc-44231, sc-44232, sc-44233, sc-44234, sc-44235, sc-44236, sc-44237 and sc-44238.

# **GENE EXPRESSION MONITORING**

MMP-10 (LA-12): sc-80197 is recommended as a control antibody for monitoring of MMP-10 gene expression knockdown by Western Blotting (starting dilution 1:200, dilution range 1:100-1:1000) or immunofluorescence (starting dilution 1:50, dilution range 1:50-1:500).

# **RT-PCR REAGENTS**

Semi-quantitative RT-PCR may be performed to monitor MMP-10 gene expression knockdown using RT-PCR Primer: MMP-10 (h)-PR: sc-41555-PR (20  $\mu$ l). Annealing temperature for the primers should be 55-60° C and the extension temperature should be 68-72° C.
