# Meprin A $\beta$ siRNA (h): sc-43926

## BACKGROUND

Meprin is a member of the astacin family of zinc metalloendopeptidases that is highly expressed in kidney and intestinal brush border membranes as well as in leukocytes and some cancer cells. It consists of two subunits,  $\alpha$  and  $\beta$ , which form disulfide-bridged homo- and heterodimers that differ in oligomerization potentials and substrate specificity. Meprin  $\alpha$  forms heterogeneous multimers and is secreted, while meprin  $\beta$  restricts the oligomerization potential of meprin to tetramers and attaches meprin oligomers to the plasma membrane. Its substrates include bioactive peptides and extracellular matrix proteins. The genes encoding human meprin  $\alpha$  and  $\beta$  map to chromosomes 6p12.3 and 18q12.1, respectively. Each meprin subunit contains a zinc-binding protease domain located between Asn-63 to Leu-260 and a carboxy-terminal MAM (Meprin, A5 protein, receptor protein-tyrosine phosphatase  $\mu$ ) domain. The meprin proteins have been implicated in cancer and intestinal inflammation.

## CHROMOSOMAL LOCATION

Genetic locus: MEP1B (human) mapping to 18q12.1.

## PRODUCT

Meprin A $\beta$  siRNA (h) is a pool of 3 target-specific 19-25 nt siRNAs designed to knock down gene expression. Each vial contains 3.3 nmol of lyophilized siRNA, sufficient for a 10  $\mu$ M solution once resuspended using protocol below. Suitable for 50-100 transfections. Also see Meprin A $\beta$  shRNA Plasmid (h): sc-43926-SH and Meprin A $\beta$  shRNA (h) Lentiviral Particles: sc-43926-V as alternate gene silencing products.

For independent verification of Meprin A $\beta$  (h) gene silencing results, we also provide the individual siRNA duplex components. Each is available as 3.3 nmol of lyophilized siRNA. These include: sc-43926A, sc-43926B and sc-43926C.

## STORAGE AND RESUSPENSION

Store lyophilized siRNA duplex at -20° C with desiccant. Stable for at least one year from the date of shipment. Once resuspended, store at -20° C, avoid contact with RNAses and repeated freeze thaw cycles.

Resuspend lyophilized siRNA duplex in 330  $\mu$ l of the RNase-free water provided. Resuspension of the siRNA duplex in 330  $\mu$ l of RNase-free water makes a 10  $\mu$ M solution in a 10  $\mu$ M Tris-HCl, pH 8.0, 20 mM NaCl, 1 mM EDTA buffered solution.

## APPLICATIONS

Meprin A $\beta$  siRNA (h) is recommended for the inhibition of Meprin A $\beta$  expression in human cells.

## SUPPORT REAGENTS

For optimal siRNA transfection efficiency, Santa Cruz Biotechnology's siRNA Transfection Reagent: sc-29528 (0.3 ml), siRNA Transfection Medium: sc-36868 (20 ml) and siRNA Dilution Buffer: sc-29527 (1.5 ml) are recommended. Control siRNAs or Fluorescein Conjugated Control siRNAs are available as 10  $\mu$ M in 66  $\mu$ l. Each contain a scrambled sequence that will not lead to the specific degradation of any known cellular mRNA. Fluorescein Conjugated Control siRNAs include: sc-36869, sc-44239, sc-44240 and sc-44241. Control siRNAs include: sc-37007, sc-44230, sc-44231, sc-44232, sc-44233, sc-44234, sc-44235, sc-44236, sc-44237 and sc-44238.

## RT-PCR REAGENTS

Semi-quantitative RT-PCR may be performed to monitor Meprin A $\beta$  gene expression knockdown using RT-PCR Primer: Meprin A $\beta$  (h)-PR: sc-43926-PR (20  $\mu$ l, 453 bp). Annealing temperature for the primers should be 55-60° C and the extension temperature should be 68-72° C.

## RESEARCH USE

For research use only, not for use in diagnostic procedures.

## PROTOCOLS

See our web site at [www.scbt.com](http://www.scbt.com) for detailed protocols and support products.
