Tim10 (C-7): sc-518241

The Power to Question

BACKGROUND

The majority of mitochondrial-directed proteins are encoded by the nuclear genome and are transported to the mitochondria via regulated processes involving the mitochondrial Tom and Tim proteins. The mitochondrial Tim protein family is comprised of a large group of evolutionarily conserved proteins that are found in most eukaryotes. Import of nuclear-encoded precursor proteins into and across the mitochondrial inner membrane is mediated by two distinct complexes, the Tim23 complex and the Tim22 complex, which differ in their substrate specificity. Defects in Tim proteins are implicated in several neuro-degenerative diseases, suggesting important roles for Tim proteins in development and health. Tim10, which maps to human chromosome 11q12.1-q12.3, forms heteromeric complexes with Tim9 and Tim12. One complex contains Tim9 and Tim10, which cross-links to the carboxy-terminal domain of Tim23. The carboxy-terminal domain of Tim23 carries all the targeting signals for Tim23, suggesting important role for the Tim9-Tim10 complex in Tim23 import. The other complex contains Tim9, Tim10 and Tim12, which associates with Tim22.
