SOD PROTEIN

Human Recombinant Superoxide Dismutase
Protein Monomer
Catalog No. SPR-435

Discovery through partnership | Excellence through quality

Product Name

SOD Protein

Description

Human Recombinant Superoxide Dismutase Protein Monomer

Applications

WB, SDS-PAGE, In vivo assay, In vitro assay

Concentration

Lot/batch specific. See included datasheet.

Conjugates

No tag

Nature

Recombinant

Species

Human

Expression System

E. coli

Purity

>95%

Protein Length

Full Length

Field Of Use

Not for use in humans. Not for use in diagnostics or therapeutics. For in vitro research use only.

Properties

Storage Buffer

PBS pH 7.4

Storage Temperature

-80°C

Shipping Temperature

Dry Ice. Shipping note: Product will be shipped separately from other products purchased in the same order.

Purification

Ion-exchange Purified

Specificity

15.936 kDa

Cite This Product

Human Recombinant SOD Protein (StressMarq Biosciences Inc., Victoria BC CANADA, Catalog # SPR-435)

Certificate Of Analysis

Certified >95% pure using SDS-PAGE analysis.

Biological Description**Alternative Names**

Superoxide dismutase1 Protein Monomer, ALS1 Protein Monomer, SOD1 Protein Monomer, IPOA Protein Monomer

Research Areas

Cancer, Cell Signaling, Chaperone Proteins, Oxidative Stress, Protein Trafficking

Cellular Localization

Cytoplasm, Mitochondrion, Nucleus

Accession Number

NP_000445.1

Gene ID

6647

Swiss Prot

P00441

Scientific Background

Superoxide dismutase (SOD) is an endogenously produced intracellular enzyme present in almost every cell in the body (3). It works by catalyzing the dismutation of the superoxide radical O_2^- to O_2 and H_2O_2 , which are then metabolized to H_2O and O_2 by catalase and glutathione peroxidase (2,5). In general, SODs play a major role in antioxidant defense mechanisms (4). There are two main types of SOD in mammalian cells. One form (SOD1) contains Cu and Zn ions as a homodimer and exists in the cytoplasm. The two subunits of 16 kDa each are linked by two cysteines forming an intra-subunit disulphide bridge (3). The second form (SOD2) is a manganese containing enzyme and resides in the mitochondrial matrix. It is a homotetramer of 80 kDa. The third form (SOD3 or EC-SOD) is like SOD1 in that it contains Cu and Zn ions, however it is distinct in that it is a homotetramer, with a mass of 30 kDa and it exists only in the extra-cellular space (7). SOD3 can also be distinguished by its heparin-binding capacity (1). Studies have shown that in vitro, Cu-Zn SOD (SOD1) fibrils are transduced into cells and function as seeds to trigger the aggregation of endogenously expressed SOD1 (9).
